

Module 1: Biology - The Study of Life - Learning Questions

1. Which characteristics together make something count as alive?
2. How is a hypothesis different from a prediction?
3. What variable is changed, measured, or controlled in a simple test?
4. Why does biology need both observation and experiment?
5. How do cells, organisms, populations, and ecosystems differ as scales?
6. What kind of evidence would challenge a claim about life?
7. Why is a scientific theory stronger than a guess?
8. How can measurement error change an interpretation?
9. What makes an explanation biological rather than just descriptive?
10. How should a claim change when new evidence appears?
