

BIOL-1 Practice Test 05

Comprehensive Final Review (Modules 01–16)

College of the Redwoods — BIOL-1: General Biology (Pelican Bay, Fall 2026)

Instructions: This practice test samples **big ideas** from every module. Work through Parts A–C. For Part C, answer in complete sentences.

✂ TEAR-OFF ANSWER SHEET **Write your name and date above. Turn in this page when instructed.**

Multiple-choice answers 1. _____ 2. _____ 3. _____ 4. _____
5. _____ 6. _____ 7. _____ 8. _____ 9. _____ 10. _____
11. _____ 12. _____ 13. _____ 14. _____ 15. _____
16. _____ 17. _____ 18. _____ 19. _____ 20. _____
21. _____ 22. _____ 23. _____ 24. _____ 25. _____
26. _____ 27. _____ 28. _____ 29. _____ 30. _____
31. _____ 32. _____ 33. _____ 34. _____ 35. _____
36. _____ 37. _____ 38. _____ 39. _____ 40. _____
41. _____ 42. _____ 43. _____ 44. _____ 45. _____
46. _____ 47. _____ 48. _____ 49. _____ 50. _____
51. _____ 52. _____ 53. _____ 54. _____ 55. _____
56. _____ 57. _____ 58. _____ 59. _____ 60. _____
61. _____ 62. _____ 63. _____ 64. _____ 65. _____
66. _____ 67. _____ 68. _____ 69. _____ 70. _____
71. _____ 72. _____ 73. _____ 74. _____ 75. _____

Fill-in answers 1. _____
2. _____
3. _____
4. _____
5. _____
6. _____
7. _____
8. _____
9. _____
10. _____
11. _____
12. _____
13. _____
14. _____
15. _____
16. _____
17. _____
18. _____
19. _____
20. _____
21. _____
22. _____
23. _____
24. _____
25. _____
26. _____
27. _____
28. _____
29. _____
30. _____

One answer per line; use the question numbers printed in the booklet.

QUESTION BOOKLET — FREE RESPONSE **Answer the free-response questions on the lined space provided.** ## Part C: Free Response (32 questions) *Answer in **complete sentences**.* Each item is tagged with its home module.* **106.** ***(Module 01)** State two characteristics of life and **briefly** explain each in your own words.

107. ***(Module 01)*** What is the difference between a **scientific theory** and a **hypothesis** in everyday lab language?

108. ***(Module 02)*** Explain how water's polarity helps it dissolve **ionic** compounds such as table salt at the molecular level (big picture, no deep math).

109. ***(Module 02)*** Why does a **buffer** matter in blood and cellular chemistry (one or two sentences of “what it does”)?

110. ***(Module 03)*** Name the **four** major classes of biological macromolecules and, for **one** class you choose, name its monomer type.

****111.**** ***(Module 03)*** What happens to a protein's function when it is ****denatured****, and what is one common cause of denaturation?

****112.**** ***(Module 04)*** Compare ****prokaryotic**** and ****eukaryotic**** cells in ****two**** sentences (nucleus + relative complexity).

****113.**** ***(Module 04)*** What is the main job of the ****mitochondria****, and where in the cell does it do that work?

****114.**** ***(Module 05)*** Contrast ****passive**** and ****active**** transport across a membrane with ****one example**** of each.

****115.**** ***(Module 05)*** In plain language, what happens to a cell placed in a ****very**

salty** external solution if the membrane is permeable to water only (animal cell framing)?

****116.**** ***(Module 06)*** Write one sentence linking ****photosynthesis**** and ****cellular respiration**** as complementary carbon/energy themes on Earth.

****117.**** ***(Module 06)*** Why do enzymes stop speeding a reaction if the temperature becomes ****too high****?

****118.**** ***(Module 07)*** Describe ****transcription**** and ****translation**** in ****two**** short sentences, using the words ****DNA****, ****RNA****, ****ribosome****, and ****protein**** sensibly.

****119.**** ***(Module 07)*** Why is ****DNA replication**** described as ****semiconservative**** at the big-picture level?

120. Contrast the goal of mitosis versus meiosis in a multicellular animal (what each type produces).

121. Name two ways meiosis increases genetic variation besides random fertilization.

122. In a monohybrid cross $Aa \times Aa$ with complete dominance, what are the expected phenotype ratios in offspring?

123. Define heterozygous and give a letter example (any gene).

124. In one short paragraph, explain how epigenetics differs from a mutation.

****125.**** ****(Module 10)**** Give one ****realistic**** example of how environment ****without**** changing DNA letters might still influence ****trait expression**** at the gene-regulation level.

****126.**** ****(Module 11)**** In two sentences, what is a ****GMO**** in food/ag contexts, and why do people disagree ethically?

****127.**** ****(Module 11)**** What does ****gel electrophoresis**** show a biologist about DNA samples (smaller vs larger fragments)?

****128.**** ****(Module 12)**** Explain ****natural selection**** in four short sentences aimed at a friend who has never taken biology.

****129.**** ****(Module 12)**** Name ****two**** independent lines of ****evidence**** that life shares common ancestry and ****briefly**** say what each shows.

****130.**** ***(Module 13)*** Define ****microevolution**** and give ****one**** example of a mechanism that can change allele frequencies ****other**** than natural selection.

****131.**** ***(Module 13)*** Contrast ****directional****, ****stabilizing****, and ****disruptive**** selection in one sentence ****each****.

****132.**** ***(Module 14)*** Contrast ****allopatric**** and ****sympatric**** speciation with ****one** sentence each******.

****133.**** ***(Module 14)*** Give ****one**** example of a ****prezygotic**** barrier and ****one**** of a ****postzygotic**** barrier.

****134.**** ***(Module 15)*** Contrast ****exponential**** vs ****logistic**** population growth; mention ****carrying capacity**** in your answer.

****135.**** ***(Module 15)*** Explain the ****10% energy rule**** and ****why**** long food chains support fewer top predators than short chains from the same plant base.

****136.**** ***(Module 16)*** In one paragraph, connect ****DNA or genes****, ****natural selection****, and ****ecosystem limits**** in a single biological system.

****137.**** ***(Module 16)*** Explain why a strong biology answer often needs to name the ****scale**** of the evidence: molecule, cell, organism, population, community, or ecosystem.

--- ***End of Practice Test 05***

QUESTION BOOKLET — MULTIPLE CHOICE AND FILL-IN **Question booklet:
answer the questions below using the tear-off sheet for Parts A and B.** ## Part A: Multiple
Choice (75 questions) *Choose the best answer for each question.* **Module 01: Study of
Life** **1.** Which property is shared by every living organism in this course's working
definition of life? A) They must move from place to place B) They all use photosynthesis C)
They are composed of one or more cells D) They are all multicellular **2.** In the scientific
method, a testable, proposed explanation that follows from observations is best called a: A)
Theory B) Hypothesis C) Law D) Conclusion **3.** In a controlled experiment, the factor the
researcher deliberately changes is usually the: A) Dependent variable B) Confounding variable
C) Independent variable D) Control group only **4.** The maintenance of a stable internal
environment (for example, temperature or blood sugar) despite external change is called: A)
Differentiation B) Homeostasis C) Metabolism D) Evolution **5.** The simplest level in the
hierarchy "cell → tissue → organ → organ system → organism" is the: A) Cell B) Organ C)
Tissue D) Population **Module 02: Basic Chemistry** **6.** The **atomic number** of an
element equals the number of: A) Neutrons only B) Electrons only in ions C) Protons in the
nucleus D) Isotopes **7.** Atoms of the same element that differ in neutron number are
called: A) Ions B) Molecules C) Isotopes D) Polymers **8.** A bond formed mainly by
transfer of electrons from one atom to another, producing attraction between opposite
charges, is: A) Covalent B) Hydrogen C) Van der Waals D) Ionic **9.** Water is polar mainly
because: A) It has hydrogen atoms only B) It cannot hydrogen-bond C) Shared electrons are
pulled unevenly, creating partial charges D) It always has pH 7 **10.** A solution with a
lower pH than 7 is: A) Basic B) Acidic C) Neutral D) A solution with pH above 7
Module 03: Organic Molecules **11.** The element that forms the backbone of
biological macromolecules is: A) Carbon B) Sodium C) Nitrogen D) Iron **12.** Amino
acids link by **dehydration synthesis** to form proteins, releasing: A) CO₂ B) O₂ C) ATP D)
H₂O **13.** The monomer (building block) of proteins is the: A) Monosaccharide B)
Nucleotide C) Fatty acid D) Amino acid **14.** Starch and glycogen are storage forms of
which class of macromolecule? A) Lipid B) Carbohydrate C) Protein D) Nucleic acid **15.**
RNA differs from DNA in several ways; one common contrast is that RNA uses the base
uracil instead of: A) Thymine B) Adenine C) Cytosine D) Guanine **Module 04: Cells**
16. A central idea of cell theory is that **new cells** arise from: A) Pre-existing cells B)
Spontaneous generation from broth C) Only the ER D) Viruses **17.** Prokaryotic cells lack
which structure that eukaryotic cells usually have? A) Ribosomes B) DNA C) A membrane-

bound nucleus D) A plasma membrane **18.** Most ATP for a typical animal cell is generated in the: A) Nucleus B) Mitochondria C) Lysosome D) Centriole **19.** In plant cells but not typical animal cells, you expect to find: A) A cell wall outside the membrane B) Mitochondria C) Ribosomes D) A nucleus **20.** Proteins are assembled on: A) Ribosomes B) The Golgi apparatus C) The smooth ER only D) Peroxisomes only

Module 05: Membranes **21.** The basic structure of the plasma membrane is described as a: A) Single layer of proteins B) Fluid mosaic of lipids and proteins C) Static rigid wall D) DNA bilayer **22.** Simple diffusion moves molecules: A) Only against a gradient with ATP B) Only in plants C) Only as ions D) With their concentration gradient, no ATP required for the diffusion step **23.** In osmosis, **water** moves: A) Against gradients always B) Toward the area with lower water (higher solute) if the membrane allows water through C) Only into dead cells D) Only when sodium ions move first **24.** Active transport differs from simple diffusion because it: A) Never uses proteins B) Can move substances against their concentration gradient using cellular energy C) Only moves water D) Does not depend on membrane proteins **25.** Which molecules typically cross a pure lipid bilayer **least** easily without help? A) Small nonpolar gases B) Water (tiny, though polar) C) Large, charged ions without channels/carriers D) Small nonpolar molecules

Module 06: Metabolism **26.** The molecule often called the cell's immediate **energy currency** is: A) DNA B) ATP C) Glucose only D) mRNA **27.** Enzymes speed reactions mainly by: A) Lowering activation energy B) Raising activation energy C) Destroying products D) Removing all substrates **28.** The summary outcome of **aerobic cellular respiration** (big picture) is that glucose is broken down and much energy is captured as: A) Only heat with no ATP B) ATP (and heat), with CO₂ and water among outputs C) Light D) Only lipids **29.** The light-capturing reactions of photosynthesis happen in chloroplast structures associated with: A) Mitochondrial cristae B) Lysosomes C) Thylakoids / grana (chloroplast membranes) D) The nucleolus **30.** Fermentation is a way some cells continue **glycolysis** when: A) Oxygen is abundant B) Photosynthesis is maximal C) Oxygen is limited, regenerating NAD⁺ so glycolysis can keep running D) DNA replicates

Module 07: Molecular Genetics **31.** The phrase **central dogma** most often summarizes: A) DNA → RNA → protein in typical gene expression B) Protein → RNA → DNA C) Only replication D) Mendel's laws only **32.** In DNA, adenine pairs (base-pairs) with: A) Guanine B) Cytosine C) Uracil D) Thymine **33.** **Transcription** produces: A) An RNA copy of a gene, using DNA as a template B) A new DNA double helix only C) A finished protein directly D) Only tRNA with

no mRNA **34.** **Translation** reads which molecule to build a protein? A) DNA directly in the nucleus only B) Only rRNA with no codons C) mRNA at the ribosome D) Lipid bilayers

35. A change in the **DNA sequence** that may alter an encoded protein is a: A) Epigenetic mark only (same textbook definition) B) Mutation C) Gene flow event D) Bottleneck only

Module 08: Cellular Genetics

36. Somatic cells reproduce for growth and repair mainly by: A) Meiosis B) Fermentation C) Mitosis (exact copy distribution to two daughter cells) D) Translation

37. Meiosis produces gametes with: A) The same chromosome number as the parent body cell B) No chromosomes C) Only mitochondrial DNA D) Half the chromosome number (haploid from diploid), with genetic shuffling

38. Crossing over (exchange between homologous chromosomes) increases variation mainly during: A) Mitosis only B) Translation C) DNA replication only in skin D) Prophase I of meiosis

39. A diploid human body cell has **46** chromosomes; a normal human sperm has about: A) 46 B) 23 C) 92 D) 0

40. The term **somatic** cell refers to: A) Body cells that are not gametes B) Only gametes C) Bacterial cells D) Dead cells only

Module 09: Inheritance Genetics

41. An organism with two identical alleles for a gene is: A) Heterozygous B) Homozygous C) Polyploid only D) Always dominant

42. In simple dominance, if **T** is tall and **t** is short, a **Tt** plant's phenotype is usually: A) Short B) Medium always C) Lethal D) Tall (dominant trait expressed)

43. A **Punnett square** is used to predict: A) Offspring genotypes / phenotypes from parental gametes B) Mitotic spindle angles only C) Only mutation rates D) Ecological carrying capacity

44. A pedigree chart tracks: A) Only fossils B) Traits through family generations C) Only food webs D) Only soil nutrient cycles

45. Mendel's idea that "heritable factors" (alleles) **segregate** into gametes underpins: A) Only natural selection B) The law of segregation (intro level) C) Only photosynthesis D) Binomial nomenclature only

Module 10: Epigenetics

46. **Epigenetics** in this course most closely means: A) Changing the DNA letter sequence permanently by CRISPR only B) Random gamete fusion C) Fermentation pathways D) Regulation of gene activity without changing the DNA sequence

47. **DNA methylation** that silences a gene region is a textbook example of: A) A missense mutation B) Mitosis C) An epigenetic mark (often "off") D) Independent assortment

48. X-inactivation in female mammals (one X compacted in each cell) helps explain, for example: A) Why men have Y in every liver cell only B) Why plants lack DNA C) Bacterial transformation only D) Calico cat patch color patterns (classic intro story)

49. Compared with a **mutation**, a typical epigenetic change to gene activity: A) Always changes the

codon sequence B) Cannot respond to environment C) Is often reversible at the “volume knob” level of expression D) Only happens in viruses **50.**

Gene expression (big picture) refers to: A) Only DNA replication B) A gene being used to produce RNA and often protein C) Only photosynthesis D) Only drift **Module 11: Genomics & Biotechnology**

PCR is used in teaching examples to: A) Amplify a targeted DNA segment in a tube B) Photograph mice only C) Replace meiosis D) Create ATP from sunlight **51.**

Gel electrophoresis separates DNA fragments mainly because: A) The phosphate backbone makes DNA negatively charged; fragments move through a gel toward positive B) Heat destroys all DNA the same way C) Lipids are charged like DNA D) Only RNA enters the gel **52.**

A **transgenic** organism carries: A) No DNA B) Only mitochondrial DNA from mother C) Foreign DNA introduced into its genome (GMO framing) D) Only fossil genes **53.**

CRISPR is often introduced as a tool to: A) Edit DNA at targeted sites (with big ethics questions) B) Ignore genes C) Make fossils D) Measure pH only **54.**

A **restriction enzyme** cuts DNA at: A) Random weather patterns B) Only RNA C) Only proteins D) Specific recognition sequences **Module 12: Darwin & Evolution**

Natural selection requires heritable variation, differential reproduction, and: A) Goal-directed “wants” of species B) Lamarckian inheritance of acquired traits as the main mechanism C) Perfect environments only D) Overproduction of offspring relative to resources (broad textbook framing) **55.**

Descent with modification means: A) Each species is fixed forever B) Only bacteria evolve C) Lineages change over time; related species share ancestors with later differences D) Evolution cannot be tested **56.**

Homology (for example similar limb bone layout, different functions) supports: A) Identical environments only B) No shared history C) Common ancestry with adaptive change D) Only convergent evolution in every case **57.**

Fitness in evolution means roughly: A) Reproductive success / allele contribution to the next generation B) Bench press strength only C) Survival with zero offspring forever D) Size only **58.**

Darwin emphasized that **populations** evolve rather than individuals mainly because: A) Individuals rewrite DNA by thinking B) Fossils are not real C) Allele frequencies change across generations in a population D) Only one individual matters per species **59.**

Microevolution is defined in this course as: A) An individual growing taller in one year B) Instant new phylum in one birth C) Only mutation in skin cells with no offspring D) Change in allele frequencies in a population over time **60.**

The **Hardy–Weinberg** model is mainly useful as: A) A null / baseline to compare real allele-frequency change against B) Proof that evolution always

speeds up C) A ban on mutation D) A species concept **63.** The **founder effect** is a type of: A) Directional selection only B) Gene flow from infinite migrants always C) Genetic drift involving a small founding group D) Photosynthesis error **64.** A **bottleneck** reduces allele diversity mainly because: A) Selection cannot happen B) Mutation stops C) K always equals zero D) A sudden severe population crash makes survivors' alleles unrepresentative by chance **65.** **Stabilizing selection** on a trait tends to: A) Favor both extremes B) Always eliminate all variation instantly C) Require polyploidy D) Favor the middle; select against extremes

Module 14: Macroevolution **66.** The **biological species concept** emphasizes: A) Reproductive isolation between groups in nature (big-picture framing) B) Color only C) Cell size only D) Fossil size only **67.** Different firefly flash patterns that reduce mating attempts are best described as: A) A postzygotic barrier (hybrid infertility) B) Geographic separation with no mating cues C) Sympatric polyploidy in one generation D) A prezygotic behavioral barrier to reproduction **68.** Mule sterility (horse $\times$ donkey hybrid) is a classic example of: A) Prezygotic temporal isolation between species B) A postzygotic barrier (reduced hybrid fertility) C) Convergent evolution in ungulates D) A prezygotic gametic barrier only **69.** **Allopatric** speciation often begins with: A) Geographic separation of formerly connected populations B) Same habitat, no separation C) Only sympatry by definition D) Only hybrid swarms always **70.** **Sympatric** speciation examples in intro courses often highlight: A) Only continental drift with zero genetics B) Plant polyploidy in the same region as a parent type C) Only fossils D) Only density independence

Module 15: Population & Systems Ecology **71.** Early **exponential** population growth (unlimited-resource phase) is often **J**-shaped because: A) Growth rate is near zero always B) Carrying capacity is always zero C) Per-capita growth can stay high while numbers are still far below limits D) Only density-dependent rules apply on day one **72.** **Carrying capacity (K)** in a logistic model is: A) The mutation rate B) Always infinite C) Gene flow only D) A long-run ceiling set by resources and other limits **73.** A disease spreading **more easily in crowded** herds is often modeled as: A) Density-dependent regulation B) Density-independent C) Only abiotic factors D) Carrying capacity with no biology **74.** The rough **$\sim 10\%$ rule** between trophic levels implies: A) 100% of energy becomes flesh always B) Only a small fraction of stored energy transfers to the next consumer level (lots lost as heat/work) C) Decomposers violate thermodynamics D) Producers get energy from consumers' heat cycling perfectly **75.** In ecosystems, **matter** (nutrient elements) cycles while energy from sunlight typically: A) Is recycled

exactly like nitrogen atoms with no loss B) Stays only in rocks forever with zero biology C) Doubles at every trophic level D) Flows through and ends largely as heat (not recycled like chemical elements in the same way energy is framed) --- ## Part B: Fill in the Blank (30

questions) *Write a short term or phrase in each blank (usually one or two words).* ###

Module 01 **76.** In a controlled experiment, a group that does **not** receive the experimental treatment (used for comparison) is often called the

group. **77.** All living things must maintain organization, reproduce, respond to stimuli, undergo metabolism, and evolve as populations; many also grow and develop while maintaining

Module 02 **78.** A covalent bond involves **sharing** pairs of

between atoms. **79.** A neutral atom has equal numbers of protons and

(in the standard model for this course). ### Module 03 **80.** The chemical bond that links amino acids in a chain is a

bond. **81.** Fats and oils belong to the macromolecule class called

Module 04 **82.** Membrane-bound sacs of digestive enzymes that break down macromolecules in many eukaryotic cells are

83. The control center that holds most DNA in a eukaryotic cell is the

Module 05 **84.** Transport proteins that open the door for molecules **without** using ATP for that step (along a gradient) perform

transport. **85.** The phospholipid tails of the bilayer are

(hydrophilic or hydrophobic)—choose the correct term. ### Module 06 **86.** The

anaerobic portion of glucose breakdown that happens in the cytoplasm (and yields a little ATP and pyruvate) is

____ (symbolic answer). ### Module 14
